

## Problem Set 9

Ch 153a – Winter 2023

Due: 3 March, 2023

1. Fox and coworkers (*Science* **1990**, *247*, 1069-1071) reported the kinetics of electron transfer in a series of Ir dimers of the following type:

A plot of the driving force dependence of the rates and a data table are show.

**Table 2.** Driving forces and rate constants for ET. Standard errors are 0.1 eV for  $-\Delta G^\circ$  and  $\pm 10\%$  for  $k_{ET}$ , except where noted.

Donor	Acceptor	$-\Delta G^\circ$ (eV)	$k_{ET}$ ( $s^{-1}$ )
$^3Ir_2^*$	2,4,6-Me <sub>3</sub> py <sup>+</sup>	0.08	$3.5 \times 10^6$
$^3Ir_2^*$	4-Mepy <sup>+</sup>	0.21	$1.7 \times 10^8$
$^1Ir_2^*$	2,4,6-Me <sub>3</sub> py <sup>+</sup>	0.58	$2.7 \times 10^{10}$
$^1Ir_2^*$	4-Mepy <sup>+</sup>	0.71	$5.0 \times 10^{10*}$
$^1Ir_2^*$	py <sup>+</sup>	0.89	$1.1 \times 10^{11}$
$^1Ir_2^*$	4-Phpy <sup>+</sup>	0.97	$>1.1 \times 10^{11}$
4-Phpy <sup>•</sup>	Ir <sub>2</sub> <sup>+</sup>	1.53	$2.0 \times 10^{10}$
4-Mepy <sup>•</sup>	Ir <sub>2</sub> <sup>+</sup>	1.61	$6.7 \times 10^9$
py <sup>•</sup>	Ir <sub>2</sub> <sup>+</sup>	1.79	$3.3 \times 10^9$
2,4,6-Me <sub>3</sub> py <sup>•</sup>	Ir <sub>2</sub> <sup>+</sup>	1.92	$6.7 \times 10^7$

\* $\pm 30\%$ .

Semiclassical electron-transfer theory predicts that intramolecular rates can be described by the following equation:

$$k_{ET} = \sqrt{\frac{4\pi^3}{h^2\lambda RT}} H_{AB}^2 \exp\left\{-\frac{(\Delta G^\circ + \lambda)^2}{4\lambda RT}\right\}$$

On the basis of the electron transfer rate data, what is the value of  $H_{AB}$  for this series of complexes? Predict the positions, extinction coefficients, and widths of the  $\text{Ir} \rightarrow (\text{R-py})^+$  charge transfer absorption bands for the four Ir compounds used in this study.

2. Photoinduced electron-transfer reactions that are relevant to photoredox catalysis are depicted in the following scheme:

Assume that immediately after excitation by a pulsed laser the concentration of the excited metal complex is  $[\text{*M}]_0$  and that  $[\text{*M}]_0 \ll [\text{Q}]$  for all quencher concentrations under consideration. In the absence of quencher  $\text{*M}$  decays back to  $\text{M}$  with rate constant  $k_0$ , and  $\text{*M}$  reacts with the quencher with a rate constant  $k_Q$ .

- Derive a rate law for the time dependence of  $[\text{*M}]$ .
- Solve the rate law to give an expression describing the time dependence of  $[\text{*M}]$ .
- Derive an expression for the quantum yield of  $\text{Q}^-$  formation.
- Assume that  $k_0$  can take on the values:  $1 \times 10^9 \text{ s}^{-1}$ ;  $1 \times 10^8 \text{ s}^{-1}$ ;  $1 \times 10^7 \text{ s}^{-1}$ ;  $1 \times 10^6 \text{ s}^{-1}$ . Assume also that  $k_Q$  can take on the values:  $1 \times 10^9 \text{ M}^{-1}\text{s}^{-1}$ ;  $1 \times 10^8 \text{ M}^{-1}\text{s}^{-1}$ ;  $1 \times 10^7 \text{ M}^{-1}\text{s}^{-1}$ . Find the quencher concentration required to give 90% quantum yield of  $[\text{Q}^-]$  for all twelve pairs of  $k_0$  and  $k_Q$  rate constants.
- If the quenching reaction yields a product concentration of  $[\text{Q}^-]_\infty$ , derive an expression for the half-time of the reaction to regenerate  $\text{M}$  and  $\text{Q}$ .
